L2 ANSWER 11 OF 11 CAPLUS COPYRIGHT 2002 ACS
AB *Pantoea citrea*, a member of the family Enterobacteriaceae, causes pink disease of pineapple, whose symptom is characterized by the formation of pink to brown discolorations of the infected portions of the pineapple fruit cylinder upon canning. Mol. genetic approaches were applied to elucidate the mechanism responsible for this fruit discoloration. A *P. citrea* mutant strain, CMC6, defective in its ability to cause pink disease and fruit discoloration, was generated by nitrosoguanidine mutagenesis. A DNA fragment that restored

these activities was isolated by screening a genomic cosmid library of *P. citrea*. A large open reading frame of 2,361 bp, identified by nucleotide sequencing of a subclone of the complementing DNA, showed high similarities to identified genes encoding glucose dehydrogenase (GDH) in *Escherichia coli*, *Acinetobacter calcoaceticus*, and *Gluconobacter oxydans*. The predicted amino acid sequence of GDH of *P. citrea* was identical to known GDHs in these bacteria by 54, 44, and 34%, resp. GDH of *P. citrea* has a predicted mol. mass of 86.2 kDa, contains a conserved binding domain for the cofactor pyrroloquinoline quinone, and possesses GDH activity as demonstrated by biochem. assay. GDH is the key branch point enzyme leading to the biosynthesis of gluconate, which in turn serves as the substrate leading to the formation of 2-ketogluconate, 2,5-diketogluconate, 6-phosphogluconate, and 2-keto-6-phosphogluconate. Addn. of gluconate to CMC6 restores the juice- and fruit-discoloring activity. Although the pigments formed by heating (or canning) have not been identified, it is clear that GDH is one of the enzymes required for pigment formation leading to pink disease.
